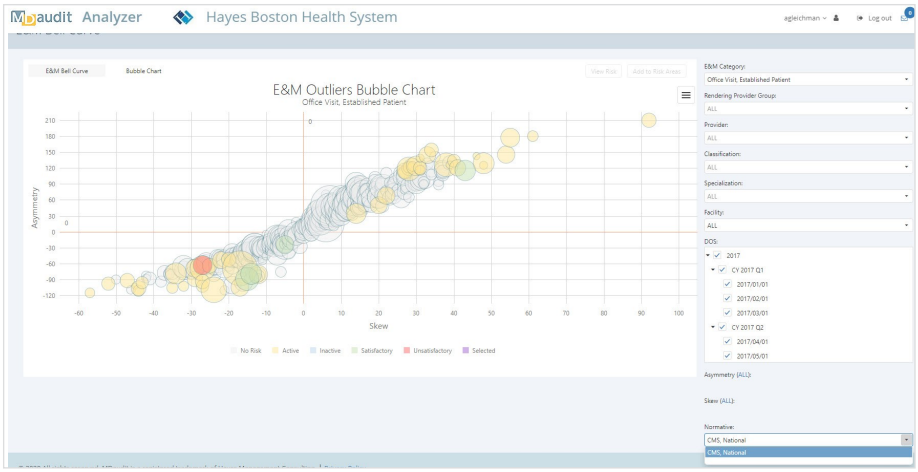
Finding Outlier Data In MDaudit Enterprise

MDaudit Enterprise's Charge Analyzer module has an anomaly detection feature that gives you the ability look at billing patterns for all the providers in your organization and compare them to both the CMS National data and MDaudit's Customer Cohort Normalized data. MDaudit also has the ability to run similar analyses on your provider's procedural based services (non E&Ms) and detect anomalies.

Within the platform, navigate to the Reports Menu and select the E&M Bell Curve. The first screen that shows will be the E&M Outlier Bubble Chart.

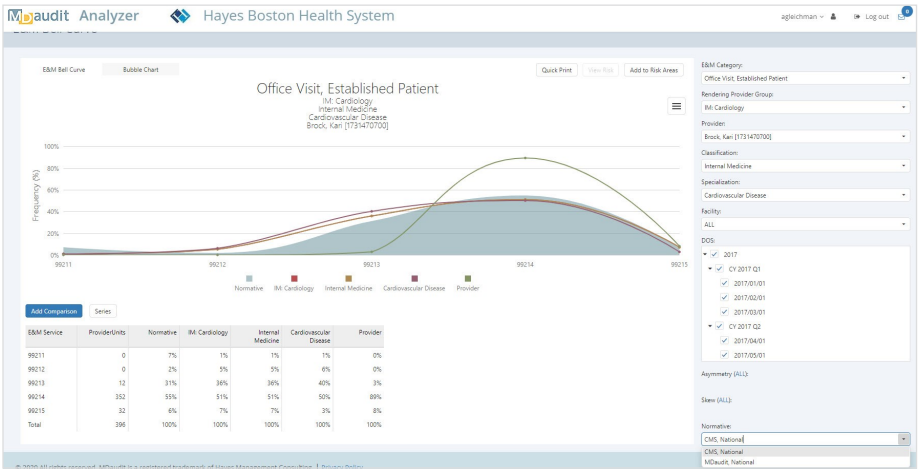


MDaudit Enterprise's Charge Analyzer ingests your provider's billing on a daily basis and identifies those providers most likely to be over-coding and/or under-coding.

Data filtering options are available on screen for E&M category, specialty and even subspecialty.

Benchmarking capabilities to compare data are also available for both CMS or the MDaudit Community within the same views.

Once those variables are entered, MDaudit Enterprise will provide a powerful analysis on how your providers compare internally to their peers AND externally to other providers within the same specialty that are being audited on the MDaudit Enterprise platform.



You can easily turn these insights into visuals to help educate providers on how their billing patterns may differ from their peers by using our E&M Bell Curve chart options.

Take action on these insights by using our audit integration capabilities and generate new audits within just a few clicks to provide future insight and analysis.
